

# SelectBehavior

Selection settings.

## Usage

```
Set_Property(OLECtrlEntID, "OLE.SelectBehavior", OptionValue)
```

## Values

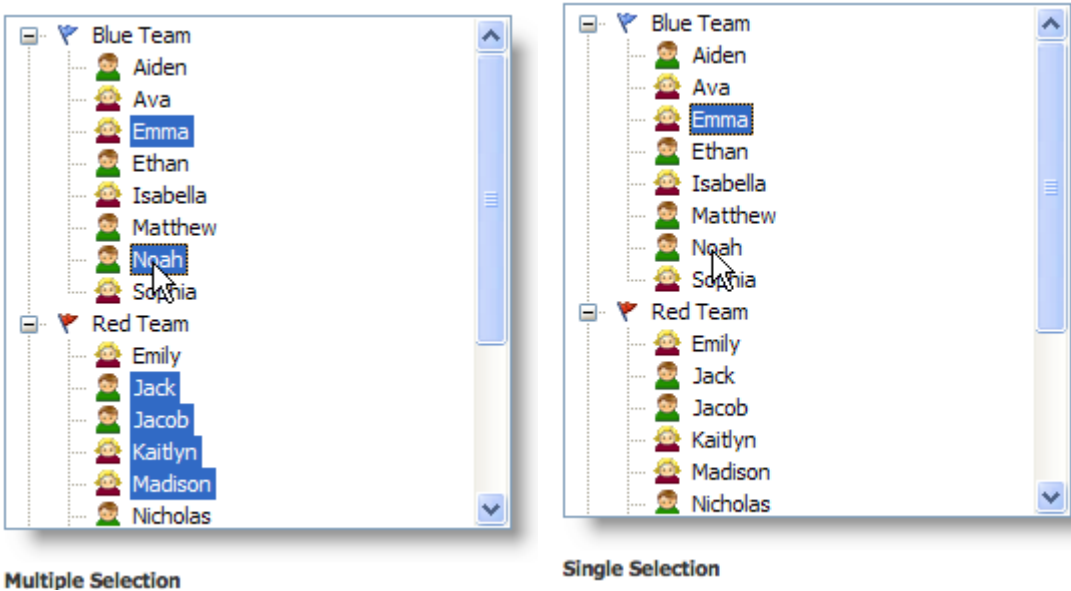

OptionValue can be set to one of the following valid options:

Value	Abbr.	Description
None	N	The user cannot select any items
Single	S	The user can select only one item at a time.
Multi	M	The user can select multiple items using the Shift and Control keys
Toggle	T	The user can toggle selection on and off by clicking on items or by pressing the Spacebar

Default: Single

## Remarks

The SelectBehavior property establishes how many items the user can select. By default, users can only select one item at a time. However, you can choose to allow users to select multiple items or to prevent users from selecting any items at all.

To allow multiple selection, set this property to "Multi" or "Toggle". The "Multi" select behavior allows users to select multiple items using the Control and Shift keys. The "Toggle" select behavior allows users to toggle an item's selection by clicking on it or using the Spacebar. Set the property to "None" if you want to prevent selection altogether, or leave the property set at "Single" to allow only one selected item at a time.

## Example

```
// Allow multiple selection
Set_Property(@Window:".OLE_TREE", "OLE.SelectBehavior", "Multi")
```
