

OLE_GetWebPage Function

Description

An OLE function used to retrieve the contents of a webpage.

Syntax

retval = **OLE_GetWebPage**(*url*, *method*, *payload*, *credentials*)

Parameters

Parameter	Description
url	The web address of the webpage to retrieve.
method	GET or POST. This parameter defaults to GET.
payload	<Optional> For a POST request, this is the POSTED data. This parameter defaults to NULL.
credentials	<Optional> If proxy authentication is needed, pass the credentials as username : @fm : password. See http://support.microsoft.com/kb/315909 for info on Proxy Authentication
headers	<Optional> An 2-level @fm-delimited array of associated @vm-delimited header values. If specified, these values are sent when the HTTP request is initiated.

Returns

The response from the URL

Remarks

This function uses the MS ServerXMLHttp protocol. This function allows calls to SSL sites and can send authenticated requests.

Example

```
Declare Function Ole_GetWebPage

url = "http://www.google.com"
retval = ole_getwebpage( url )
Swap Char(13) : char(10) With @fm In retval
Swap char(10) With @fm In retval
Swap @fm With char(13) : char(10) In retval
OSWrite retval To "C:\url.txt"
```
