SRP Sketch Control

The SRP Sketch Control is a utility control which allows users to sketch a diagram pertinent to their industry. For example, pest control companies can use it to sketch rough diagrams of houses and label the diagram with pest control findings. Or a company that builds parts can load up predefined parts and label them with customizations.

The SRP Sketch Control makes it easy for users to sketch an idea. It is not a fully-fledged imaging system on the order of Photoshop. Its goal is to provide end users with efficient sketching and labeling. As a developer, you establish predefined labels and icons so users can rapidly identify important elements of their illustrations. Basic sketching functionality is available, from single lines to complex polygons to annotations.

Prog ID	SRP.Sketch.1
