DDELINK

Applies to

Edit box, edit line.

Description

Establishes a DDE link with a server, in one of four modes.

Usage

Return the current DDE link status:

currentlink = **Get_Property** (*objectname*, "**DDELINK**")

Set the link status:

existingprop = **Set_Property** (*objectname*, "**DDELINK**", *linkstatus*)

Remarks

linkstatus can have one of the following four values.

DDELINK Keyword	Description
HOT	Server sends linked data, as soon as that data changes. When the server notifies the OpenInsight control of the change, the DDEADVISE event handler for the associated control is invoked, and the data specified by the connection is passed.
WARM	The DDEADVISE event for the associated OpenInsight for Workgroups control is invoked by the server, but the affected data is not copied to that control until the DDEDATA property is set.
AUTO	Same as HOT, but the data is updated upon notification from the server, without invocation of the DDEADVISE event.
COLD, OFF	Turns off any notification by the server, until any of the other three properties is invoked.
