MODIFIED

Applies to

Combo box, edit box, edit line.

Description

Checks, sets, or resets the Boolean Modified flag, for combo and edit boxes, and for an edit line. This flag is set to true when a value that had appeared in one of these controls is modified.

Usage

modifyflag = **Get_Property'** *(***objectname***, "MODIFIED")*

existingprop = **Set_Property** (*objectname*, **"MODIFIED"'**, *truefalse*)

Remarks

Values passed in Set_Property:

Value	Description
truefalse	Any non-zero or null value, to set, and zero or null to reset.

For an unbound edit control, MODIFIED acts like the window's SAVEWARN property in that it is set if changes to the control have occurred. The MODIFIED flag is actually maintained by the control itself. You can query it, set it, or reset it using this property.

Returns

Values returned by both Get_Property and Set_Property:

Value	Description
modifyflag	Boolean value, indicating state of Modified flag.
existingprop	Existing value, when Set_Property was run.
