

# NOTIFYPOS

## Applies to

Edit table

## Description

Returns the position where the last action occurred. Use with [Get\\_Property\(\)](#), only.

## Usage

*selecteditem* = **Get\_Property** (*objectname*, "NOTIFYPOS")

## Remarks

[Get\\_Property\(\)](#) returns Column:@FM:Row for the cell in the edit table where the last action occurred. This property works in cases where the [SELPOS property](#) cannot specify a specific cell. For example, in a multi-selection edit table, [SELPOS](#) returns all selected rows while **NOTIFYPOS** returns just the row that was clicked on.
