

ORIG STRUCT

Applies to

All controls.

Description

Used only with [\(\)](#), returns the structure with initial values of the control.

Usage

column = **Get_Property** (*objectname*, "ORIG_STRUCT")

Remarks

This is useful when you want to manipulate a non changeable property for a particular control. You can procedurally capture the control's attribute information, manipulate the desired property, destroy the control, and then re-create the control using the modified information gathered from **ORIG_STRUCT**. For an example, see the **TABBED_TEMPLATE** form's [CREATE event](#) in the **EXAMPLES** application.

Returns

An @VM delimited array of the control's attributes and values. Refer to the PS_EQUATES record for positional information about the layout of the array.
