

PREVSELPOS

Applies to

Edit table.

Description

Returns the previously selected cell in an edit table. Use with `Get_Property`, only.

Usage

previousposition = **Get_Property** (*objectname*, "PREVSELPOS")

Returns

Value returned by `Get_Property`:

Value	Description
<i>previousposition</i>	Position of the previously selected cell in an edit table, in the following format:
	previous column : @fm : previous row

This property is extremely useful when used in the [POSchanged event](#), which is passed the new position as a parameter, but not the old position.
