

XLIST

Applies to

Combo box, edit table, list box.

Description

Returns or sets the items that appear in the list box or drop-down list box. For an edit table control, the value returned or passed separates column data from row data. XLIST ensures that any visible "space" is filled with blank rows. Used by the SemanticLogicLayer and implemented in Set_Property.

Usage

existingprop = **Set_Property**(*objectname*, "XLIST", *newlist*)

Remarks

Values passed in Set_Property:

Value	Description
newlist	Data items to appear in the specified control. Rows are delimited by @FM, and columns are @VM-delimited.

Returns

Values returned by Set_Property:

Value	Description
itemlist	For combo box and list box, an @FM-delimited array of items. For edit table an @FM-delimited array of rows, where columns are @VM-delimited.
existingprop	List of values, when Set_Property was run. That is, the values before they were changed.
