

# Struct\_Flush Subroutine

## Description

Flushes any cached structure definitions.

## Syntax

```
''Struct_Flush'' ''(structname)''
```

## Parameters

The structure-related functions cache structure definitions in order to execute without any I/O. In a multi-developer environment, it is possible for one developer to change a structure definition and another developer to have an older definition of that structure still cached.

Parameters	Description
<i>Structname</i>	Specifies the structure definition to remove from cache; if no name is specified, all cached definitions are flushed.

## Example

```
Flushing the entire cache from the command line:  
run Struct_Flush
```
