

Yield Subroutine

Description

Checks for pending events in the Windows event queue and executes them. Returns control as soon as the event queue is empty.

Syntax

Yield()

Remarks

Note: All pending events will be executed. This includes OpenInsight and Windows events. It is good practice to handle process dependent conditions (such as a Close event) after a Yield() call.

Examples

```
done = FALSE$
Loop
ReadNext ID Else done = TRUE$
Until done
* Allow for an event, such as CLICK
Yield()
* Process ID record
Repeat
```
