

# POS BY CURSOR

## Description

Determines the cell that the mouse cursor is over. This is the same as [POS\\_BY\\_CLIENT\\_CURSOR](#) message except that it returns the SCREEN coordinates rather than the CLIENT coordinates.

## Applies to

Edit table.

## Syntax

```
cellPos = Send_Message(controlID, "POS_BY_CURSOR", cursorX, cursorY)
```

## Parameters

Parameters are as follows.

| Parameter | Description   |
|-----------|---|
| CursorX   | The X position of the mouse cursor in the SCREEN coordinates. |
| CursorY   | The Y position of the mouse cursor in the SCREEN coordinates. |

**Note:** If the parameters are null then the system using the current position of the cursor.

## Return value

Returns the column:row of the cell.

If the column value is 0 then the cursor is over a row label.

If the row value is 0 then the cursor is over a column header.

If the column and row values are null then the cursor is not over a cell, row label or column heading.
