# ScrollPos

The top-left most visible cell beyond the FreezePos.

## Usage

```
Set_Property(OLECtrlEntID, "OLE.ScrollPos", Array)
```

## Values

*Array* has the following structure:

| Pos | Name | Type | Description | Default |
|-----|------|------|-------------|---------|
| <1> | Scroll Column | Integer | The left most visible column following the freeze column | 1 |
| <2> | Scroll Record | Integer | The top most visible record following the freeze record | 1 |

## Remarks

The ScrollPos property represents the current scrolling position. It's the top-left-most cell that is visible beyond the FreezePos value. For example, the smallest possible value for ScrollPos with a FreezePos value of 1:FM:1 is 2:FM:2. Setting the ScrollPos property to a larger value programmatically scrolls the table.

If either field is set to a value larger than the scrolling limit, then the table is scrolled only to that limit. Likewise, if either field is set to a value less than or equal to the freeze position, then the table is scrolled to the beginning.
