

MixedCase Function

Description

Given a string, returns the string with initial capitalization (the first character of each word in upper case, the rest of the word in lower case).

Note: For a more complete capitalization function, use [NameCap\(\)](#).

Note: To convert from upper case to lower case, or vice versa, see the example in the [Convert statement](#).

Syntax

```
result = MixedCase(source_string)
```

Parameters

The MixedCase function has the following parameter.

Parameter	Description
source_string	An OpenInsight string.

Returns

result = A string with initial capitalization.
