

# Service\_Setup

This is the equivalent of the [HTTP\\_Service\\_Setup](#) insert but it is used by the core SRP FrameWorks utility service modules. [HTTP\\_Services](#), [HTTP\\_JSON\\_Services](#), and [HTTP\\_Authentication\\_Services](#) rely upon this insert. The reason they do not rely upon [HTTP\\_Service\\_Setup](#) is because they are *not* HTTP service modules in the strictest sense. That is, they do not manage HTTP requests but function as *application* (or *support*) *services*. *Application services* (whether prefixed with *HTTP* or not) always use the original SRP FrameWorks [SOA](#) design.
