

SRP_Path RemoveDirectory

Removes everything except the last component of a path.

Syntax

```
NewPath = SRP_Path("RemoveDirectory", Path)
```

Parameters

Parameter	Description
Path	A path with or without command line parameters.

Returns

The path without the directory.

Remarks

The RemoveDirectory service returns the given path without the directory. Thus, it returns only the filename and extension. Quotes are preserved.

Note. This method supports paths that contain command line parameters. In this case, command line parameters are returned along with the filename and extension.

Example

```
Path = "C:\path1\path2\path3\filename.txt"  
Result = SRP_Path("RemoveDirectory", Path)
```

Result will be "filename.txt".
