

SRP_HTTP_FRAMEWORK_VERSION

Stores the current version of the SRP HTTP Framework product in the following format:

Attribute	Name	Description
<1>	Version Number	The version number will be in the standard x.x.x format (e.g., 1.0.0). If this is a release candidate, then it will be followed with a RCx (e.g., 1.0.0 RC2). The HTTP_Services module includes the <i>GetVersion</i> service which will return this information. However, it will swap the @FM delimiter with \0D0A\ so that it is more more web friendly.
<2>	Build Date and Time	The build date and time will be in this format: MM/DD/YYYY HH:MMAM/PM
