

INET_EQUATES

This is a Revelation Software supplied insert that provides structure and definition for the various attributes in the @FM delimited HTTP request that the OECGI sends into the designated listener routine (e.g., [RUN_OECGI_REQUEST](#) or [HTTP_MCP](#)).

The reason it is included in the SRP HTTP Framework module is because there are a few newer attributes which are missing from older versions of [INET_EQUATES](#):

Equ	OECGI_VERSION\$	To	27
Equ	GET_STRING\$	To	28
Equ	POST_STRING\$	To	29
Equ	ADDITIONAL_VALUES\$	To	30
