RunHTTPService

Calls the indicated HTTP web service routine.

Syntax

```
Response = HTTP_Services('RunHTTPService', HTTPService, RemainingURL)
```

Returns

N/A

Parameters

Parameter	Description
HTTPService	The HTTP (or web) service to call. **Required**
RemainingURL	This is the remaining portion of the URL that has not yet been processed by previous services. **Required**

Remarks

The *RunHTTPService* service is the official way to call specific web service APIs. The *HTTPService* argument should contain the same name found in the URL segment that corresponds with the API resource. For instance, for the `/customers` URL, the *HTTPService* argument should contain the value of *cust omers*. This will call the `HTTP_CUSTOMERS_SERVICES` BASIC+ routine.

The *RemainingURL* argument will contain the value of the remaining portion of the URL that follows the current URL segment. Examples of managing this are found in the HTTP_Entry_Point_Services routine.
