GetResponseHeaderField

Returns the value previously set for the indicated Response Header Field.

Syntax

```
Response = HTTP_Services('GetResponseHeaderField', Name)
```

Returns

The value set for the specific HTTP response header field.

Parameters

Parameter	Description
Name	Header Field Name to get. **Required.**

Remarks

The *Name* argument is case-insensitive but if the indicated Response Header Field has not been set then an error condition will be set. Any value can be entered for the *Name* argument, but there is a pre-defined list of standard HTTP response header field names which have been defined as metadata for this service to make it easier for the developer to select one. The current list is as follows:

Access-Control-Allow-Headers
Access-Control-Allow-Methods
Access-Control-Allow-Origin
Allow
Content-Encoding
Content-Language
Content-Length
Content-Location
Content-Disposition
Content-Type
Date
Expires
Last-Modified
Link
Location
Retry-After
Server
Set-Cookie
Transfer-Encoding
Vary
