

GetEnableAuthenticationFlag

Returns the enable authentication flag setting.

Syntax

```
Response = HTTP_Services('GetEnableAuthenticationFlag')
```

Returns

A Boolean value indicating whether or not authentication is enabled for this web application. This is used by the [HTTP.Authentication.Services](#) routine to determine if any authentication should be attempted.

Parameters

N/A

Remarks

It pulls this from [SRP_HTTP_FRAMEWORK_SETUP <4>](#). Note: Only an explicit setting of *False* (0) will turn this flag off.
