

MFS Operations Reference

This chapter provides a reference for all MFS calls. Included in this chapter are:

- Parameters for all seven MFS arguments as they are passed by BASIC+, and as they are returned by the BFS
- Information on the commands in OpenInsight that invoke specific calls
- Notes on the implementation of the calls and on disabling them

The list provided here is current as of release 4.12 of OpenInsight. However, BFS definitions are subject to change, and an update or Upgrade may add to or change the definition. Review all documentation provided with any update or upgrade or contact Revelation Technologies about changes required to an MFS after any update.
