

# Repository

Command	Description
<a href="#">CompDoc()</a>	Used to store multiple discrete records within a single record. The DataSet definition, compiled DataSet, and Connection definition records are stored as CompDoc records. Do not access or modify CompDoc records directly; instead, use the CompDoc function.
<a href="#">Get_Contract()</a>	Retrieves contract block information for a specified stored procedure.
<a href="#">GetEntity()</a>	Displays the OpenInsight common open dialog as used by the User Interface and Client/Server workspaces.
<a href="#">Get_Repos_Entities()</a>	Returns a list of all entities classified under the specified application, type, and class.
<a href="#">NewEntity()</a>	Displays the OpenInsight common new dialog as used by the User Interface and Client/Server workspaces.
<a href="#">Recompile_Proc subroutine</a>	Recompiles one or more specified stored procedures.
<a href="#">Repository()</a>	Use to issue methods to repository objects (entities).
