

SRP_Regex ExtractAll

Extracts all pattern matches from a string.

```
Result = SRP_Regex("ExtractAll", String, Pattern)
```

Returns

An @FM delimited list of all matches, if found, or "" if no matches are found.

Parameters

Parameter	Description
String	The target string to be pattern matched. (REQUIRED)
Pattern	The regex pattern. (REQUIRED)

Remarks

The ExtractAll service is a simplified version of the [SearchAll](#) service. Instead of returning a structure of information, this service simply returns an @FM delimited list of matched strings. This is useful when you are using regex to parse out information.

Examples

```
String      = 'Call 800-555-1212 for info, or fax us at 888-555-3535'  
Pattern     = '((\d{3})(?:\.\|-))?(\\d{3})(?:\.\|-)(\\d{4})'  
PhoneNums  = SRP_Regex("ExtractAll", String, Pattern)
```
