

SRP_List GetVariable

Converts an SRP List back into a BASIC+ variable.

Syntax

```
Var = SRP_List("GetVariable", Handle, Delim)
```

Returns

The BASIC+ representation of the list.

Parameters

Parameter	Description
Handle	Handle to an existing SRP List (REQUIRED)
Delim	Delimiter to insert between elements (OPTIONAL, @FM by default)

Remarks

The GetVariable service converts an SRP List back into a BASIC+ delimited list. The list will be delimited by the character you pass through the Delim parameter. If you omit the Delim parameter, then the list will be delimited by field marks.

Examples

```
// Get the list delimited by @FM
List1 = SRP_List("GetVariable", Handle);

// Get the list delimited by @SVM
List2 = SRP_List("GetVariable", Handle, @SVM);

// Get the list delimited by commas
List3 = SRP_List("GetVariable", Handle, ",");
```
