

CellButtonEnabled

Establishes whether a cell's button is enabled or disabled.

Usage

```
Set_Property(OLECtrlEntID, "OLE.CellButtonEnabled[field; record]", Boolean)
```

Values

[True | False]

Default: True

Indices

Index	Description
field	Index to an existing field
record	Index to an existing record

Remarks

The CellButtonEnabled property provides a way to enable or disable a button cell. Set this to TRUE to enable or FALSE to disable. By default, buttons are enabled and are not affected by the value of the [CellProtection](#) property. In order to ensure the button looks disabled, set custom disabled colors in the [CellType](#) property.

This property is only valid for cell's whose [CellType](#) property has been set to "Push Button."

Example

```
// Disable all buttons in the first column
Set_Property(@Window:".OLE_EDITTABLE", "OLE.CellButtonEnabled[1; All]", 0)

// Enabled all buttons
Set_Property(@Window:".OLE_EDITTABLE", "OLE.CellButtonEnabled[All; All]", 1)
```
