

# Formatting Text

You can format text, but you're limited to prefixes and suffixes. You can use any characters in your format, but the string "%S%" will always be swapped with actual text data. Any other character is treated as a literal and is displayed as is. Currently, there is no way to show "%S%" as a literal, i.e., it will *a/ways* be swapped with the data.

As an example, assume the data is "Kevin".

To Display As	Use
First Name: Kevin	First Name: %S%
Kevin Esquire	%S% Esquire
Code guru Kevin works for SRP Computer Solutions, Inc.	Code guru %S% works for SRP Computer Solutions, Inc.
