

Code for Populating the Combo Box from Access

Below is the code, placed in the [CLICK event](#) of the **Populate Combo Box** button, that populates the combo box:

If you would like to populate the combo box automatically, place this code in the [CREATE event](#) of the window. The button would be unnecessary.

```
$insert XO_Equates
hXO = XOInstance('NWIND')

if hXO then

    hQry = QryInstance(hXO)

    if hQry then
        flag = QryMethod(hQry, QRY_EXECUTE$, "select companyname from customers order by      companyname")

        row = ""
        results = ""
        loop
            flag = QryMethod(hQry, QRY_GETROW$, row)
            while flag
                results<-1> = row
            repeat

            QryMethod(hQry, QRY_DESTROY$)
        end

        rv = Set_Property (@window : '.COMPANIES', 'LIST', results)

        XOMethod(hXO, XO_DESTROY$)

    end
```
