

Database ID vs Application ID

In older versions of the Revelation database, the **account name** referred to the database. In OpenInsight, the equivalent is more clearly referred to as a Database ID, or simply **@DBID**. OpenInsight **.DBT** files correspond to **@DBID**.

There is a second ID, which often has the same value as the Database ID: the Application ID, or simply **@APPID**. OpenInsight repository storage, object code location, and event chaining are based on **@APPID**. **@APPID** contains application specific fields, including the database name, which is stored in **@APPID<2>**.

Remember to use **@DBID** when referring to the persistent name of the database.
