

Final Steps

There are two other records in the dictionary that should be deleted, **%PROTECT.SPEC%** and **%FIELDS%**.

1. From the System Editor EXEC line, execute the following two commands:

```
Run DELETE_ROW 'DICT.TABLENAME' , '%PROTECT.SPEC%'
```

```
Run DELETE_ROW 'DICT.TABLENAME' , '%FIELDS%'
```

2. After deleting these records, reattach the file and the system will recreate these records, reflecting the changes made to the dictionary.

At this point the file has had all indexes removed. The deleted indexes can now be rebuilt safely, using the list that you made in the [Finding the Indexes](#) step.
