

# Processing the Received Data in the Dialog Box

The [CREATE event](#) of the **COLLECTORWINDOW** dialog box also has a **CreateParam** argument, which will contain the creation parameter sent from the [Dialog\\_Box\(\)](#) function. The code in this event can process the data sent, typically to set properties on controls contained in the window. This is an illustrative code sample:

```
declare function Get_Property, Set_Property
$insert Ctrl_Property_Equates
if CreateParam # '' then
  convert @fm to @rm in createParam
  ctrls = @window: '.EDITLINE_1' : @rm : @window : '.EDITLINE_2'
  props = DEFPROP$ : @rm : DEFPROP$
  rtn = Set_Property (Ctrls, props, CreateParam)
end
```

In this example, two edit lines (**EDITLINE\_1** and **EDITLINE\_2**) are initialized to "data 1" and "data 2" respectively, using [Set\\_Property\(\)](#), with one call setting both edit lines.
