Processing the Received Data in the Dialog Box

The CREATE event of the **COLLECTORWINDOW** dialog box also has a **CreateParam** argument, which will contain the creation parameter sent from the Dialog_Box() function. The code in this event can process the data sent, typically to set properties on controls contained in the window. This is an illustrative code sample:

```
declare function Get_Property, Set_Property
$insert Ctrl_Property_Equates
if CreateParam # '' then
   convert @fm to @rm in createParam
   ctrls = @window: '.EDITLINE_1' : @rm : @window : '.EDITLINE_2'
   props =      DEFPROP$           : @rm :      DEFPROP$
   rtn = Set_Property (Ctrls, props, CreateParam)
end
```

In this example, two edit lines **(EDITLINE_1** and **EDITLINE_2)** are initialized to "**data 1**" and "**data 2**" respectively, using Set_Property(), with one call setting both edit lines.
