Processing the Received Data in the Window

The window receives the returned data from the dialog box as the return value from the Dialog_Box() function. The data can be processed based on requirements. In this sample code, properties are set in the calling window to set its **BEGIN_DATE** and **END_DATE** controls to the values passed by **COLLECTORWINDOW**.

```
rtnData = Dialog_Box("COLLECTORWINDOW", @window, CreateParam)
if rtnData then
   convert @fm to @rm in rtnData
   ctrls = @window :'.BEGIN_DATE' : @rm : @window: '.END_DATE'
   props = DEFPROP$              : @rm : DEFPROP$
   rtn = Set_Property( ctrls, props, rtnData)
end
```
