

Creating the Visual Basic Project

We have completed the steps to prepare the OpenInsight server to process requests from our Visual Basic client program. It's time to work on the Visual Basic side. Do the following:

1. Create a Visual Basic project.
2. Add a Command button called **Command1**.
3. From the main menu, select **Project References** to access the list of library references available. A reference to the **RevSoft 1.0 Type Library** should display after scrolling the list box. Check it. The list of references should display as shown below:

Note the association of the type library with **xrev.dll**.
