

Create the Promoted Event Processing Code

This is the function (**PE_GotFocus**) that performs the required processing. In this case, the function will update an **EDITLINE** control named **STATUSLINE** with some help text.

Create a new stored procedure and paste the following code:

```
compile function PE_GotFocus( CtrlEntID, CtrlClassID, PrevFocusID)
* This function performs the actual processing necessary. In this case we update the
* EDITLINE control named STATUSLINE with the control type of the current control
Declare Function Get_Property, Set_Property
Val = Set_Property( @window : '.STATUSLINE', 'TEXT', CtrlClassId)
return 1
* Return 1 continues up the event chain
* Return 0 terminates the event chain
```

Save and compile this function as **PE_GotFocus**. This is the function called from the [PE_GotFocus_Shell](#) commuter module.
