

# The Zoom Window CREATE Event

In the [CREATE event](#) of the ZOOM window add the following procedural event handler.

```
if len(CreateParam) then
  .eb_Text->TEXTVAL = CreateParam
end
return 0
```

The code sample above:

Checks to see if data (the **CreateParam**) has been passed to the ZOOM window on the [CREATE event](#).

If it has, then (using shorthand notation) assign the **CreateParam** to the edit box's [TEXTVAL property](#). This is the same as the [TEXT property](#), with the additional step of converting **@TM**, **@SVM**, and **@VM** to carriage return-line feed (**Char(13):Char(10)**) for [Set\\_Property\(\)](#), and **Char(13):Char(10)** to **@TM** for [Get\\_Property\(\)](#).
