

# ActiveForm

The currently visible embedded form.

## Usage

```
Set_Property(OLECtrlEntID, "OLE.ActiveForm", Name)
```

## Values

*Name* can be any string.

**Default:** ""

## Remarks

The ActiveForm property sets the currently visible form that was embedded using [AddNamedForm](#).

***This property must be called after using AddNamedForm, since AddNamedForm will not set the active form.***

## Example

```
// Add two windows to the form, then show the second one
NewWindow = Start_Window("MY_FIRST_WINDOW")
Handle = Get_Property(NewWindow, "HANDLE")
Send_Message(@Window:".OLE_PANEL", "OLE.AddNameForm", Handle, "FORM_A", 1, 0)
NewWindow = Start_Window("MY_SECOND_WINDOW")
Handle = Get_Property(NewWindow, "HANDLE")
Send_Message(@Window:".OLE_PANEL", "OLE.AddNameForm", Handle, "FORM_B", 1, 0)
Set_Property(@Window:".OLE_PANEL", "OLE.ActiveForm", "FORM_B")
```
