

# CreateLogFile

Creates a log file in the designated capture path.

## Syntax

```
Response = HTTP_Services('CreateLogFile', LogType, Data)
```

## Returns

N/A

## Parameters

Parameter	Description
LogType	The type of log to be written. This can be user-defined. <b>Required</b>
Data	Information used to create the log body. Some log types ignore this. <b>Optional</b>

## Remarks

The predefined *LogType* values are *Request*, *Response*, *ProcErr*, and *Debugger*. All log files use the [GetSessionID](#) service to create part of the filename and are stored in the path derived from the [GetCapturePath](#) service. The final format follows this pattern:

YYYY-MM-DD\_HH-MM-SS\_<ProcessID>\_<Counter>\_<LogType>.log

*ProcessID* is created with the GetCurrentProcessID Windows API.

*Counter* is an internal counter tracked by the current session and increases for each log created. It is formatted as "R#(0)6".

*LogType* is the type of log that the caller has requested.
