

# HTTP\_Debugger\_Service

This routine is a template for handling Runtime Errors when the Debugger Intercept mode has been set.

## Syntax

```
Response = HTTP_Debugger_Service(Void)
```

## Returns

N/A

## Parameters

N/A

## Remarks

Because HTTP\_Debugger\_Service is a Debugger Intercept routine, it does not accept any arguments. It uses the RTI\_DEBUG\_COMMON insert to get the state of the debugger. If this routine is called, [HTTP\\_Aborted\\_Service](#) will only receive Status Errors.
