

AfterUpdate

Fired after a cell's contents has been updated.

Parameters

| Parameter | Description |
|------------|--|
| Cell | Cell whose text has been updated. The column and row values are semicolon delimited. |
| Text | Updated contents of the cell |
| Conversion | The cell's conversion pattern |

Remarks

The AfterUpdate event is fired when the user changes a cell's data by either tabbing out of the control or leaving the edit table entirely while editing a cell. By the time this event is fired, the cell's text has been updated, and its old text may only be returned by performing an Undo. To check for cell updates even sooner, capture the BeforeUpdate event.

The Cell parameter indicates the cell that has been updated, and the Text parameter contains the cell's new contents.
